

(4 pts) A poor quality graphene sample is prepared with the shape shown below. The numbered features (pins) are considered to be perfect contacts. Conventional current injected at pin 1 and extracted at pin 4 is $3\mu\text{A}$. Pins 2 and 3 contact the horizontal bar separated by $8\mu\text{m}$, and the voltage measured across pins 2 relative to pin 3 is 20 mV . Pin 3 and 5 contact the bar separated by $2\mu\text{m}$. The voltage measured at pin 3 relative to pin 5 is plotted vs a magnetic field applied normal and into the page. Assuming one type carrier, what is the mobility, sheet carrier density, and carrier type (justify your answer).

q	$1.6 \times 10^{-19} \text{ C}$	electron charge
ϵ_0	$8.85 \times 10^{-14} \text{ F/cm}$	permittivity of free space
K_s	11.8 (Si)	relative dielectric constant
K_o	3.9 (SiO ₂)	relative dielectric constant
k_B	$8.617 \times 10^{-5} \text{ eV/K}$	Boltzman's constant
h	$6.63 \times 10^{-34} \text{ J s}$	Planck constant
m_o	$9.11 \times 10^{-31} \text{ kg}$	electron mass
$k_B T/q$	0.0259 V at 300 K	thermal voltage
c	$3 \times 10^8 \text{ m/s}$	speed of light
